Referring to SANYO Catalogue, a description will be given of an expansion device for a notebook PC MBC G1/G1F and the difference from the present invention. The expansion device is configured to connect an expansion auxiliary storage device for the PC body to a dedicated expansion connector of the PC body via a dedicated cable. When two or more auxiliary storage devices are connected, they may be connected serially as the expansion connector of the PC body initially includes an interface connectible to the auxiliary storage devices. The following diagram illustrates an exemplified configuration of SANYO notebook PC MBC-G1/G1F.

However, the above configuration inherently has its limitation on usable connector specifications, and thus on specifications of the expansion auxiliary storage devices. Accordingly, in the above example, if a succeeding specification of the PC devices other than CD-ROM drive and FDD, the expansion cable and expansion body should be altered. Therefore, every time a need for establishing connection with another kind of the expansion device arises, another specification of the expansion unit and a cable therefor should be

newly designed, while in order to establish connection with the FDD, connection with the CD-ROM drive is required. Further, an addition of an interface signal to the expansion connector would disadvantageously raise the size of the connector, imposing limitations on positions in the device where the connector is connectible, and increase the thickness of the cable, requiring the cable to be longer in light of its reduced flexibility.

Referring now to PANASONIC Catalogue, a description will be given of an expansion method for a subnotebook PC CF-S51J8 and the difference from the present invention. According to this expansion method, common I/O connectors for compatible PCs and an FDD interface are integrated into a single expansion connector. The following diagram illustrates an exemplified configuration of PANASONIC subnotebook PC CF-S51J8.

However, the above configuration, which simply provides an integral device of an I/O box and FDD, as no reference is made to connection with an externally connecting type of auxiliary storage devices other than FDD, if the connection with an auxiliary storage device other than FDD is desired to be established, the I/O box needs a change of its configuration. Accordingly, the above method would disadvantageously require a change of the I/O box upon changing the expansion auxiliary storage device.
